

**What's All the Talk?** Our viewers weigh in on the week's top trending topics.

**Why White House Hasn't Backed CISA**  
"This bill has never been about "information sharing." It originates in the Intelligence Committee and "intelligence" is what it is about. It throws a bone to business in the form of immunity for snitching to the Feds on one's customers."

**Masquerading: New Wire Fraud Scheme**  
"One more example of why we need strong authentication, even on e-mail. Once or twice a month I get an e-mail from a friend or colleague that is obviously fraudulent. In the last quarter I have gotten e-mails from two friends stating that they were stranded in Istanbul and asking me to advance them a couple of thousand dollars."

**NY Proposes Bitcoin Regulations**  
"Bitcoin is the internet of money and you can't regulate that. Banks and government want this kind of regulation to continue...doing what they're doing, just stealing the money of the people and destroying our world economy."

**Delaware Restaurants: Breach Victims?**  
"The use of strong authentication on all remote access will take most restaurants or chains off the very big target list. The payment card processors serving the restaurant industry are encouraging the use of EMV-ready point-of-sale devices, at some small cost to the restaurant operators."

**Researcher: Cryptolocker Not Dead Yet**  
"It was a really bold move of the FBI to claim that CryptoLocker is dead. There have been many cases, post-this-claim, of PCs being infected with this ransomware. Users have to look into software that can withstand this nasty ransomware."
